animals and the increasing beak size of finches on the Galapagos Islands

Misconceptions Natural selection is not a random process it acts on existing variation within populations

2 Genetic Drift This refers to random fluctuations in allele frequencies within a population It is particularly impactful in small populations where chance events can significantly alter the genetic makeup

Examples Founder effect a small group colonizes a new area bottleneck effect a population is drastically reduced

Misconceptions Genetic drift does not always lead to adaptive evolution

3 Adaptation This refers to the process by which organisms become better suited to their environment over time

Adaptations can involve physical traits behaviors or physiological processes

Examples The long necks of giraffes allow them to reach high foliage the streamlined body of a dolphin reduces water resistance and the ability of bacteria to metabolize certain compounds

Misconceptions Adaptations are not always perfect they are shaped by the environment and existing genetic variation

4 Speciation This is the process by which new species arise from existing ones It typically occurs when populations become isolated and evolve independently leading to genetic divergence and reproductive isolation

3 Examples The formation of new species on islands the divergence of populations due to geographic barriers and the development of new species through hybridization

Misconceptions Speciation is a gradual process that takes place over many generations

5 Phylogeny This refers to the evolutionary history of a group of organisms

Phylogenetic trees are used to visualize evolutionary relationships based on shared traits and genetic similarities

Examples The phylogenetic tree of primates shows the evolutionary relationships between humans apes and monkeys

Misconceptions Phylogenetic trees are hypotheses that can be revised based on new data
